

SME CASHFLOW PREDICTOR AI

The Autonomous Virtual CFO Platform for Modern Enterprise

Strategic Vision: Why the App Was Made

- **The Post-Mortem Spreadsheet Dilemma:** Traditional accounting tools track historical records. They tell you where capital went, but fail to project where cash is going.
- **Prohibitive Executive Overhead:** Hiring dedicated financial analysts or full-time strategic human CFOs requires significant capital outside the reach of growing SMEs.
- **Asymmetrical Receivable Friction:** SMEs suffer when enterprise buyers drag physical invoice processing past agreed terms. This system removes that blindspot.

Core Engine Metrics & Exact Calculations

Calculated Current Cash

Formula: Sum of all streaming ledger balances minus immediate cleared real-time transaction outflows.

Provides a solid current cash-in-hand absolute baseline layer before future rolling projections run.

Survival Safety Runway

Formula: Current Basis Liquid Cash / Average Monthly Net Outflow

If net burn is negative or zero, labeled as 'Infinite' structural safety. Dynamically warns of impending balance crunches.

Liquidity Quick Ratio

Formula: (Cash & Equivalents + Current Receivables) / Current Liabilities

Instantly signals systemic operational bottlenecks. Ratios below 1x trigger critical immediate warning highlights.

Average Monthly Outflow (Net Burn)

Formula: Sum of Fixed + Recurring Outflows over a trailing 3-month block.

Isolates regular software SaaS commitments, workspace rents, salaries, and recurring vendor payments from one-off charges.

Automated Operational Ingestion & Processing

Import Historical Ledger (.CSV)

- Eliminates manual ledger synchronization errors.
- Accepts standard comma-delimited accounting logs directly.
- Automatically cleans, parses, and formats messy raw historical bank entries.
- Maps data columns instantly into active baseline model parameters.

Smart Inflow Invoice Estimator

- Accounts receivable rarely land perfectly on Net 30 due dates.
- Evaluates unique client behavioral risk factors and custom parameters.
- Applies a trailing historical delay coefficient to invoices.
- Recomputes actual expected collection runway windows rather than ungrounded contract timelines.

Predictive Simulation & Conversational Terminal

Predictive Business Scenario Engine

- Pre-Built Switches: Toggle events like 'Hire & Office Expansion' (-\$17,500/mo) or 'Enterprise Contract Win' (+\$25k up-front).
- Custom Natural Language Sandbox: Type regular prompts like 'What happens if we acquire an \$80k expansion loan at 8% paid over 24 months?'
- Projects downstream impacts 6 months out without capital risk.

AI CFO Copilot (Kashflow Advisor)

- Chat Terminal: Active co-pilot interpreting cash status query strings.
- Recommends concrete structural maneuvers to lower SaaS/overhead burn and optimize cash buffers.
- Directly integrated with the Interactive Transaction Book—a clean real-time ledger sorting inflows/outflows by automated model confidence status layers.

Replacing the Traditional Executive Bottleneck

Autonomous Virtual Advisory Architecture

- **Continuous Auditing:** Human financial reporting operates on broken month-end blocks. The AI streams analytics continuously as ledgers update.
- **Objective Math Forecasting:** Eliminates optimistic internal reporting bias via non-linear predictive model algorithms.
- **Fractional Operational Cost:** Delivers high-level cash architecture modeling for small businesses at a fraction of executive placement costs.

High-Fidelity Executive Reporting

One-Click Print PDF Protocol

Instantly exports complete sandbox parallel forecast variations, rolling horizon models, and current balance states into formatted compliance documents for immediate submission to board directors, active seed investors, or corporate lending partners.

Strategic Value Matrix

[Processing Cadence] Traditional Frameworks: Delayed manual batch processing at fiscal close windows.

▲ **Predictor AI:** Automated direct ingestion streaming with live updates.

[Analytical Horizon] Traditional Frameworks: Static linear calculations assuming perfect flat growth.

▲ **Predictor AI:** Non-linear client behavioral models mapping transaction risks.

[Risk Mitigation] Traditional Frameworks: Reactive balance adjustments after depletion happens.

▲ **Predictor AI:** Proactive safety alerts weeks ahead of a cash bottleneck point.

[Scenario Sandbox] Traditional Frameworks: Fragmented spreadsheet versions prone to formula corruption.

▲ **Predictor AI:** Infinite parallel sandbox paths built seamlessly with plaintext inputs.
